

Make Copilot Pay Off

Most organisations do not have a Copilot problem, they have a value problem: licences are paid for but barely used. This checklist helps you turn the Microsoft 365 Copilot licences you already pay for into measurable value. Every item includes why it matters and how to do it.

1. Before you roll out

☐ **Define the outcomes you expect value from**

Why: "Roll out Copilot" is not a goal; saved hours and better work are.

How: Pick 3–5 concrete tasks (meeting recaps, email drafting, document search) and the time or quality gain you want from each.

☐ **Pick a focused pilot group and champions**

Why: Value spreads from visible wins, not from mass licensing.

How: Choose 1–2 teams with a real, repetitive need and an enthusiastic champion who will lead by example.

☐ **Fix data oversharing and permissions first**

Why: Copilot is only as safe and accurate as the access behind it.

How: Clean up broad SharePoint access so Copilot returns the right answers instead of surfacing oversharing.

☐ **Baseline the time spent today**

Why: You cannot prove a gain you never measured.

How: Record how long the target tasks take now, so you can show the difference later.

2. Licensing & cost

☐ **Assign licences to people who will actually use them**

Why: Industry studies show a large share of Copilot licences go unused, and idle licences are pure cost.

How: Assign to weekly, high-need users first, not to the whole organisation at once.

☐ **Review and reclaim unused licences on a cycle**

Why: Usage tells you where the money is working and where it is not.

How: Check usage after 30–60 days and reassign idle licences to people on the waiting list.

☐ **Measure active usage, not licences bought**

Why: Licences purchased is a vanity number; active usage is the real one.

How: Use the Copilot usage and adoption dashboard as your headline measure.

3. Enablement

☐ **Run role-based training with real prompts**

Why: Generic demos do not change behaviour, but relevant ones do.

How: Short, role-specific sessions using prompts for people's actual work, not toy examples.

☐ **Share quick-start guides per app**

Why: Most users stall because they do not know what to ask.

How: One-pagers for the top use case in Teams, Outlook, Word and Excel.

☐ **Build a champions community**

Why: Peer momentum sustains use long after launch day.

How: A Teams channel where champions share wins, prompts and tips.

☐ **Offer office hours and one clear support channel**

Why: Friction kills new habits; easy help keeps them.

How: A weekly drop-in and one obvious place to ask questions.

4. Measure & sustain

☐ **Set adoption KPIs that reflect value**

Why: What you measure is what improves.

How: Track weekly active users, tasks automated and self-reported time saved, against your baseline.

☐ **Review usage every month and act on it**

Why: Reports only help if they change something.

How: Spot the teams that stall and help them, rather than just circulating numbers.

☐ **Reclaim and reallocate idle licences**

Why: Continuous reallocation keeps spend tied to value.

How: Move unused licences to active users or the waiting list each cycle.

☐ **Retire what is not landing, scale what is**

Why: A few strong use cases beat many weak ones.

How: Drop use cases that do not stick and double down on the ones that do.
